

Manga Tutorial

This tutorial will show you how to create the all the rage Manga's of any car you wish. This tut will give you one rendition and you will have to work from that.

Step 1

all right well i think we should start with a simple car like this rx7
 other bases like this can be found at mangacars.com
 just go look in the stock manga cars section

first open the car in photo shop
 you will use the pencil tool which can be found by right clicking on the paint brush
 this will be used with a 1 pixel tip for the outlines of things.

ok, we will be learning how to make a custom front bumper today
 open the image in photo shop

Step 2

t we will be making a shade chart for the car
 select the eyedropper tool(shortcut = i) and select the darkest shade that you see on the car
 then switch to the pencil and make the brush size about 7 pixels and make a dot of color in the
 white space surrounding the car switch back to the eye dropper and repeat this until you have
 made a dot of all the shades

Step 3

create a new layer by clicking the  button
 then grab the pencil tool and hit D to make the foreground color black, then draw the basic shape
 that you want the kit to be

Step 4

(HINT: the easiest way to make the kit perfectly symmetrical is to make half of the outline then copying that layer by dragging it to the  button and going up to edit>transform>flip horizontally then lining it up on the other half of the car.)
if the line is not complete then grab the pencil and fill in the empty spots

Step 5

now hit ctrl+E to merge the two layers into one

the next step is to lay down a base color. this is done by clicking the  button to make a new layer then grabbing the eye dropper tool (shortcut = i) and clicking on the main color of the car

now color like a coloring book (inside the lines) use the pencil to do this.

Step 6

now it is time for the shade chart to come to use

make a new layer again by clicking the  button select the eyedropper tool (shortcut = i) and select the darkest color on the shade chart

now make a 1 pixel line of this color in the areas that would be the darkest like the bottom

Step 7

peat this with the other colors use common sense think about how the light is hitting the car and where it would be darker or lighter

here's what i came up with after using all the different shades to color the kit this is a very simple plain kit with simple shading

Step 8

i bet your thinking that the kit looks funny with the car showing through the hole in the kit here's where we will fix that. hit d on the keyboard to make the foreground color black and then click on the layer named background. color black over the car where it is showing through the hole also there is a bit of gray showing under the kit so hit x to switch to white and color that part white.

Step 9

now switch back to the outline layer and erase the black line on the top of the kit
